Farm : <u>T</u>	Tank : <u>T-101</u>	Site Number : <u>299-W10-103</u>
N-Coord : <u>43,593</u>	W-Coord : <u>75,637</u>	TOC Elevation : <u>673.04</u>
Water Level, ft : <u>85.5</u>	Date Drilled : <u>8/31/1973</u>	

**Casing Record**

Type : <u>Steel-welded</u>	Thickness, in. : <u>0.237</u>	ID, in. : <u>4</u>
Top Depth, ft. : <u>0</u>	Bottom Depth, ft. : <u>94</u>	
Type : <u>Steel-welded</u>	Thickness, in. : <u>0.280</u>	ID, in. : <u>6</u>
Top Depth, ft. : <u>0</u>	Bottom Depth, ft. : <u>94</u>	

Cement Bottom, ft. : 94      Cement Top, ft. : 0

**Borehole Notes:**

Borehole 50-01-06 was drilled in August 1973 to a depth of 94 ft with 6-in. casing. In September 1980, the 6-in. casing was perforated from 0 to 20 ft and 92 to 94 ft. A 4-in. casing liner with a metal cap welded on the bottom was positioned inside the 6-in. casing. The entire annulus between the 4-in. and 6-in. casings was filled with grout. The thicknesses of the 4-in. and 6-in. casings are presumed to be 0.237 in. and 0.280 in., respectively, on the basis of the published thickness for schedule-40, 4-in. and 6-in. steel tubing.

**Equipment Information**

Logging System : <u>2B</u>	Detector Type : <u>HPGe</u>	Detector Efficiency: <u>35.0 %</u>
Calibration Date : <u>11/1997</u>	Calibration Reference : <u>GJO-HAN-20</u>	Logging Procedure : <u>MAC-VZCP 1.7.10-1</u>

Borehole

**50-01-06****Log Event A**

Log Run Number :	<u>3</u>	Log Run Date :	<u>06/30/1998</u>	Logging Engineer:	<u>Alan Pearson</u>
Start Depth, ft.:	<u>87.5</u>	Counting Time, sec.:	<u>200</u>	L/R : <u>L</u>	Shield : <u>N</u>
Finish Depth, ft. :	<u>68.0</u>	MSA Interval, ft. :	<u>0.5</u>	Log Speed, ft/min.:	<u>n/a</u>

**Logging Operation Notes:**

This borehole was logged by the SGLS in three log runs using a 200-s counting time. The top of the borehole casing, which is the zero reference for the SGLS, is approximately flush with the ground surface. The total logging depth achieved was 87.5 ft.

**Analysis Information**

---

Analyst : E. LarsenData Processing Reference : MAC-VZCP 1.7.9Analysis Date : 01/06/1999**Analysis Notes :**

The pre-survey and post-survey field verification for each logging run met the acceptance criteria established for peak shape and system efficiency. The energy calibration and peak-shape calibration from the accepted calibration spectrum that most closely matched the field data were used to establish the peak resolution and channel-to-energy parameters used in processing the spectra acquired during the logging operation.

This borehole was completed with 4-in.- and 6-in.-diameter casings along the entire logged interval. A casing correction factor for a 0.517-in.-thick steel casing was applied to the concentration data. The entire annulus between the 4-in. and 6-in. casings is filled with grout, making it impossible to produce accurate radionuclide assays. However, man-made and natural radionuclides were identified and apparent concentrations are reported.

Approximately 2.9 ft of water has collected inside the bottom of this borehole. A water correction factor was applied to the water-filled interval.

**Log Plot Notes:**

Separate log plots show the man-made and the naturally occurring radionuclides. The natural radionuclides can be used for lithology interpretations. The headings of the plots identify the specific gamma rays used to calculate the concentrations. Uncertainty bars on the plots show the statistical uncertainties for the measurements as 95-percent confidence intervals. Open circles on the plots give the MDL. The MDL of a radionuclide represents the lowest concentration at which positive identification of a gamma-ray peak is statistically defensible.

A combination plot includes the man-made and natural radionuclides, the total gamma derived from the spectral data, and the Tank Farms gross gamma log. The gross gamma plot displays the latest available digital data. No attempt has been made to adjust the depths of the gross gamma logs to coincide with the SGLS data.

A plot is included that compares the Radionuclide Logging System (RLS) log-run data collected in 1992 with the SGLS log-run data collected in 1998. Uncertainty bars and MDLs are not included on any of these plots.

Borehole

50-01-06

Log Event A

A time-series plot is included that shows the maximum gross gamma count rate in the 45- to 70-ft depth range between 1975 and 1994. Portions of the declining gross gamma activity over time are compared to the calculated decay curves for specific radionuclides.

Plots of representative historical gross gamma log data collected between 1975 and 1994 are also included.

**Results/Interpretations:**

The radionuclide concentrations identified in this section are reported as apparent concentrations only and are underestimated.

The man-made radionuclides Cs-137, Co-60, Eu-154, and Eu-152 were detected by the SGLS. The Cs-137 contamination was measured continuously from the ground surface to a depth of 25 ft. Isolated occurrences of Cs-137 were detected at 26.5, 31, and 36.5 ft. The Co-60 contamination was measured continuously from 49.5 ft to the bottom of the logged interval (87.5 ft). The Eu-154 contamination was measured nearly continuously from 49.5 to 60 ft. A small zone of Eu-154 contamination was detected from 65 to 66.5 ft. A single occurrence of Eu-152 was detected at 55.5 ft.

Most of the U-238 concentrations are absent from 52 to 57.5 ft and 74 to 83 ft.

The K-40 concentration values increase sharply at 38 ft and remain elevated to depth of 50 ft. An increase in the K-40 concentrations occurs at about 71 ft. The KUT concentrations increase at about 81 ft and generally remain elevated to the bottom of the logged interval.

Additional information and interpretations of log data are included in the main body of the Tank Summary Data Reports for tanks T-101 and T-104.
